# Prerequisite 2 - Proxy Configuration

This article has been generated from the online version of the catalog and might be out of date. Please, make sure to always refer to the online version of the catalog for the up-to-date information.

Auto-generated at November 21, 2024

Connect platform runs in the external network and needs to be able to make requests to the APS Controller running on the CB Commerce management node as schematically illustrated below:

In order to provide connectivity to the APS Controller, configure the following settings:

- **Outbound proxy** must be configured to send outgoing requests from APS Controller to the Connect platform.
- **Inbound Proxy (API Gateway)** service that will receive requests to the APS Controller from Connect that is accessible to the public network and forward them to the APS Controller deployed in your backend network.

Proxies are configured in the CB Commerce under the **System > Settings > APS Connection: Proxy settings** menu:

## Outbound Proxy

The simplest way to configure outbound proxy in CB Commerce platform is to use tinyproxy, a light-weight proxy that will allow management node and other servers that must interact with external endpoints and has no direct connection to internet. This guide assumes following:

- You have a server that has backnet and frontnet connectivity
- All servers in backend can reach the selected server on a given port, in this example: port 8008
- Server where tinyproxy will be installed can reach internet directly.

## Deploying tinyproxy on a Centos server

The *tinyproxy* is available as part of epel-release repository, in case you don't have it enabled, you can do it with the help of yum:

```
# yum install -y epel-release
```

Once *epel-release* is enabled, you can install tinyproxy by using the following command:

```
# yum install -y tinyproxy
```

Once the installation is completed, it is required to configure tinyproxy. Edit file **/etc/tinyproxy/tinyproxy.conf** with the help of vim or another text editor. In the configuration file, please notice this parts:

```
#  
# Port: Specify the port which tinyproxy will listen on. Please note  
# that should you choose to run on a port lower than 1024 you will need  
# to start tinyproxy using root.
```

```
#  
Port 8888
```

Directive Port exposes where tinyproxy will listen. For our example, let's change 8888 to 8008

```
#  
# Allow: Customization of authorization controls. If there are any  
# access control keywords then the default action is to DENY. Otherwise,  
# the default action is ALLOW.
```

```
#  
# The order of the controls are important. All incoming connections are  
# tested against the controls based on order.
```

```
#  
Allow 127.0.0.1
```

Allow directive exposes what IPs are allowed to use tinyproxy as proxy, let's imagine that your backend network is 10.0.0.0/24 and you want to allow all servers in such network to use it. In such case, please introduce an Allow directive like follows:

```
#  
# Allow: Customization of authorization controls. If there are any  
# access control keywords then the default action is to DENY. Otherwise,  
# the default action is ALLOW.
```

```
#  
# The order of the controls are important. All incoming connections are  
# tested against the controls based on order.
```

```
#  
Allow 127.0.0.1  
Allow 10.0.0.0/24
```

Multiple allow directives are possible.

Once configuration file is set, you can start tinyproxy service

```
# systemctl start tinyproxy
```

please do not forget to enable tinyproxy on system start, to enable it you can run

```
# systemctl enable tinyproxy
```

Note that tinyproxy is not the only possible solution. Any other service capable of proxying HTTPS traffic will also work (such as <https://trafficserver.apache.org>). If you have an alternative proxy solution already deployed, it could also be used for proxying APS Controller's outbound traffic. It is required, however, that this proxy solution does not cache its responses to avoid situations like getting outdated resource usage data, etc.

## Inbound Proxy

The inbound gateway (proxy) must:

1. Be accessible from the Connect platform and have access to the Operations Automation Management Node (backnet interface).
2. Have trusted (valid) SSL certificate for the connector backends SSL validation.

There are multiple ways to configure an Inbound API Gateway that would meet the above requirements. In this document we provide one example of the Inbound API Gateway configuration with the Nginx (see <https://www.nginx.com/>) running on a CentOS Virtual Machine. In order to configure in inbound API gateway using Nginx on CentOS, please follow the steps below.

### 1. Prepare Virtual Machine (VM) running CentOS 7 with two network interfaces

The following network interfaces need to be configured:

- Frontnet - network facing the public network
- Backnet - network facing the CB Commerce management node

### 2. Install Nginx into the VM

You can do that by enabling the epel-release repository:

```
[root@inboundPROXY ~]# sudo yum install epel-release
Loaded plugins: fastestmirror, langpacks
Loading mirror speeds from cached hostfile
Resolving Dependencies
--> Running transaction check
---> Package epel-release.noarch 0:7-11 will be installed
--> Finished Dependency Resolution
(output continues)
```

Installed:

```
epel-release.noarch 0:7-11
```

Complete!

after that, install nginx:

```
[root@inboundPROXY~]# sudo yum install nginx
Loaded plugins: fastestmirror, langpacks
Resolving Dependencies
--> Running transaction check
---> Package nginx.x86_64 1:1.12.2-2.el7 will be installed
(output continues)
```

Complete!

### 3. Configure SSL certificate in Nginx

Please refer to the Nginx (see [http://nginx.org/en/docs/http/configuring\\_https\\_servers.html](http://nginx.org/en/docs/http/configuring_https_servers.html)) documentation for detailed instructions. You can get a free certificate from Let's Encrypt to get started, before buying a permanent certificate as demonstrated below. In any case, please ensure you load a valid SSL certificate before continuing.

### 4. Configure reverse proxy in Nginx

#### 4a. In Nginx configuration file

The file is located at `/etc/nginx/nginx.conf` find the location of the 'server' directive and add the following configuration options:  
HTML

```
server { # reverse proxy

    listen 6308 ssl http2 default_server; # could be any inbound port
    listen [::]:6308 ssl http2 default_server; # could be any inbound port
    server_name _;
    ssl_certificate "/etc/nginx/apsc-proxy.crt";
    ssl_certificate_key "/etc/nginx/apsc-proxy.key";
    ssl_session_cache shared:SSL:1m;
    ssl_session_timeout 10m;
    ssl_ciphers HIGH:!aNULL:!MD5;
    ssl_prefer_server_ciphers on;

    ...
}
```

Once 'server' section setup is complete, please find the location / directive. By default it will look like this:

```
location /
{
}
```

and needs to be updated to include the following settings:

```
proxy_pass https://<MN_BACKNET_IP>:6308; # must be port 6308
proxy_http_version 1.1;
proxy_redirect off;
proxy_read_timeout 86400;
proxy_send_timeout 86400;
proxy_set_header X-Real-IP $remote_addr;
proxy_set_header X-Forwarded-For $proxy_add_x_forwarded_for;
proxy_set_header Host $http_host;
proxy_set_header X-Forwarded-Proto $scheme;
}
```

Please refer to the example configuration file for details:

#### 4b. Reload Nginx

```
$ service nginx restart
Redirecting to /bin/systemctl restart nginx.service
```

#### 4c. Verify that the proxy works correctly

You may verify nginx configuration accessing the proxy over a browser to its secure location. This will provide a message like the following:

```
{"error": "APS::Util::Exception", "message": "Forbidden"}
```

This message is OK and means that the APS controller on management node is responding. If you get an error page instead of the correct response, it is possible that the outgoing connection is blocked by SELinux. Check `/var/log/audit/audit.log` for errors; if there are denied messages for Nginx, you can either disable SELinux completely or configure it to allow this outgoing connection for Nginx. There are multiple ways to do this. In this example, we allow nginx to be on permissive policy:

```
$ semanage permissive -a httpd_t
```

If that did not help, verify that the APS Controller's URL as you configured it in `proxy_pass` in Nginx configuration is accessible from your proxy machine.

### Assign a valid SSL certificate

It is strongly recommended to assign a valid SSL certificate to the Inbound API Gateway (proxy). There are numerous ways to obtain and assign this certificate. In this example, we explain how to retrieve and assign free SSL to your proxy using <https://certbot.eff.org>. Your proxy will have to be internet-visible in order to use <https://certbot.eff.org>.

#### 1. Install certbot-nginx package

```
$ sudo yum install python2-certbot-nginx
```

#### 2. Start nginx service

If this command fails, ensure that you don't have apache running on same server

```
$ service nginx start
Redirecting to /bin/systemctl start nginx.service
```

#### 3. Enable certbot for nginx

Please answer the questions that script will do and ensure that when asked for the hostname, you specify the public name of your proxy, this one must be publicly reachable

```
$ sudo certbot --nginx
```

This command will automatically install the certificate for you on nginx. Please remember that let's encrypt certificates expires

quite often and you may have to enable a cron job to autorenew it. This can be done via inserting a line in crontab like:

```
0 0,12 * * * python -c 'import random; import time; time.sleep(random.random() * 3600)' && certbot renew
```

For more information on certbot, please refer to the certbot documentation.

Now you can set as outbound proxy the public name using https protocol on the proxy settings configuration section on CB Commerce.

## Firewall Configuration

We generally do NOT recommend setting up additional firewall rules as they can significantly complicate migration and upgrade procedures within your infrastructure.

However, if you still want to limit your inbound proxy to only allow connections originated from the Connect platform, please refer to the Firewall Configuration article for details.
