In order to use *CloudBlue Connect* node on Flowgear and establishing the connection between both platforms, it is required to create a Token on Connect. The following guidelines showcase how to create a token and how successfully configure this connection.

Create Your Flowgear Token

First of all, it is necessary to create a Flowgear token on the CloudBlue Connect platform as follows:

Access the **Tokens** section of the **Integrations** module on Connect platform.

Click the **Create Token** button to configure your new token. Once the system prompts you to define your token extension, select the **Flowgear** option.

-

-

In case more information on your token creation is required, refer to the Integrations module documentation.

Connection Configuration

Access the **Connections** section on the Flowgear platform and click **+** to create a new connection. Thereafter, configure this connection as follows:

- **Name:** Specify your connection name by using this field.
- **Node:** Select the *CloudBlue Connect* node.
- **Site Environment:** Choose Test or Production environment for your connection.
- **URL:** Enter the Connect API endpoint in this field.
- **Flowgear Token:** Enter your token that is created on the Connect platform. It is highly recommended to use the corresponding *copy* icon. Otherwise, your token might not be copied correctly.

Once your connection configuration is complete, click the **Save** button on the Flowgear user interface. It is also possible to test your connection by using the **Test** button.
