Video Overview

Plan Your Workflow

A Flowgear integration consists of an automated workflow that connects your apps and services together. Every integration has a Start node. It is required to put into the canvas selected nodes to define your integration workflow. Note that the Flowgear platform features different types of Nodes:

- Connectors
- Triggers
- Processors
- Evaluators

Once you add a new node you can see all of the kind of nodes available to make your workflow.

![x]

Therefore, before starting to build your workflow, it is important to look at a large number of nodes in the repository.

It is also important to learn how to successfully configure your connection on Flowgear. Refer to the Flowgear Connection article for more details
