In order to integrate the Connect platform to the Workato system, it is necessary to generate an API key, prepare the hub identifier, and prepare marketplace names. Follow the provided instructions to successfully integrate CloudBlue Connect to the Workato automation platform.

## Connect Operations

### Generate API Key

First of all, it is necessary to create an API token on the CloudBlue Connect platform as follows:

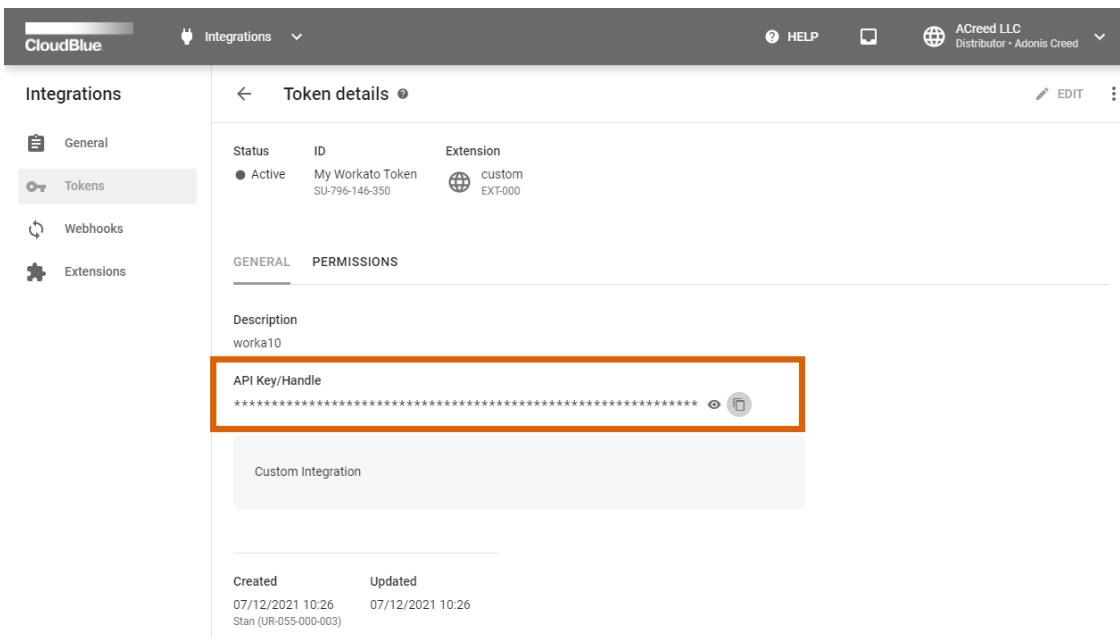

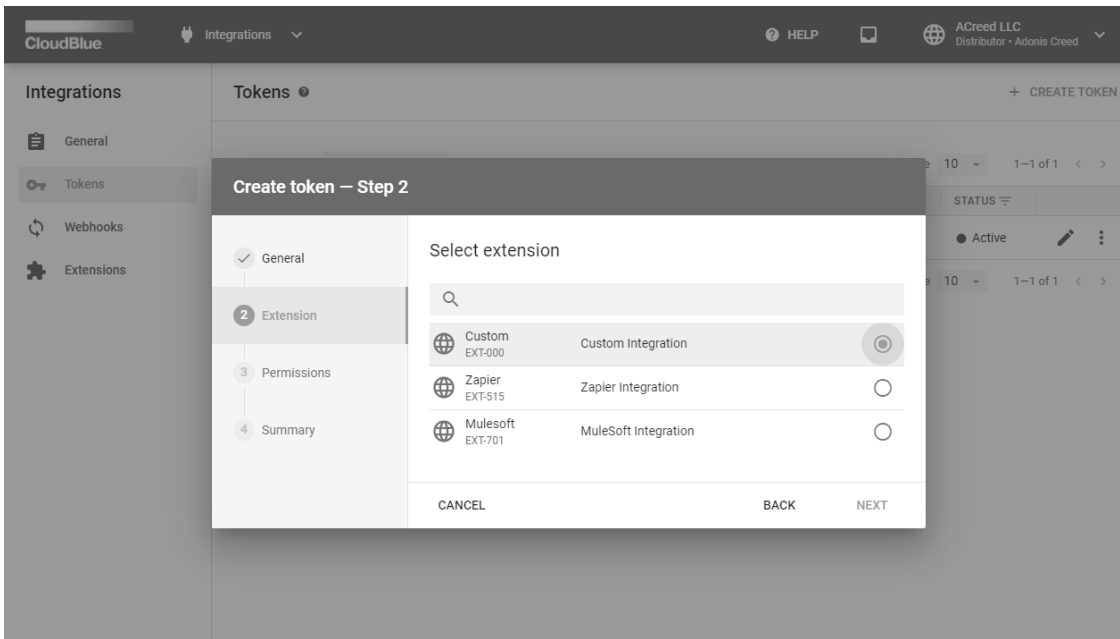

Access the **Tokens** section of the **Integrations** module on Connect platform.

Click the **Create Token** button to configure your new token. The system prompts you to define your token extension, select the **Custom** option. Once the token configuration is finalized, access your token details screen to copy your *API/Key Handle* value.

The screenshot shows the CloudBlue Integrations module with the 'Tokens' section selected. The left sidebar lists 'Integrations', 'General', 'Tokens' (selected), 'Webhooks', and 'Extensions'. The main content area is titled 'Tokens' and features a '+ CREATE TOKEN' button in the top right corner. Below the button, there are controls for 'REFRESH', '1 FILTER APPLIED', and 'COLUMNS'. A table with columns 'LABEL', 'EXTENSION', 'CREATED', and 'STATUS' is displayed, showing 'No data available'.

LABEL	EXTENSION	CREATED	STATUS
No data available			

In case more information on your token creation is required, please refer to the Integrations module documentation.

## Prepare Your Hub ID

The Workato platform requires you to specify your registered hub identifier. Access the **Marketplaces** module and switch to the **Hubs** tab. Thereafter, copy your hub identifier that is displayed under your hub object name.

## Prepare Your Marketplace Names

To successfully integrate the CloudBlue Connect platform with the Workato system, it also requires to paste your names of your Connect marketplaces. Access the **Marketplace** module and switch to the **Directory** tab. Thereafter, copy your required marketplace names from the list.

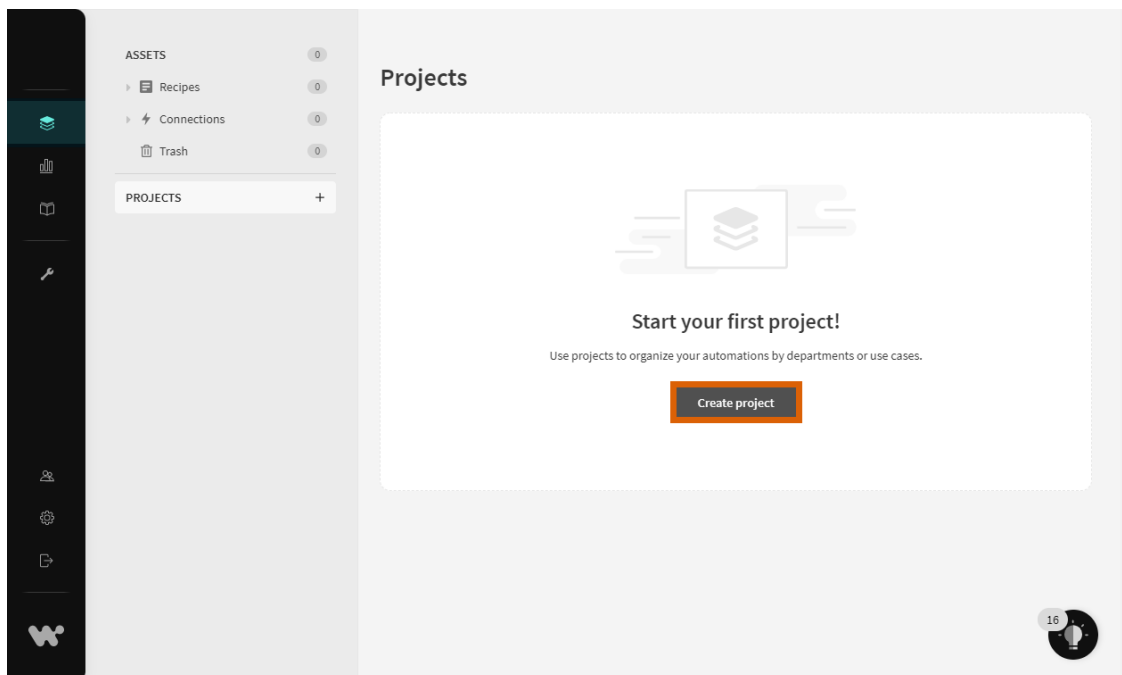

This concludes required configurations and preparations on the CloudBlue Connect platform. Therefore, it is required to access the Workato platform for the following configurations.

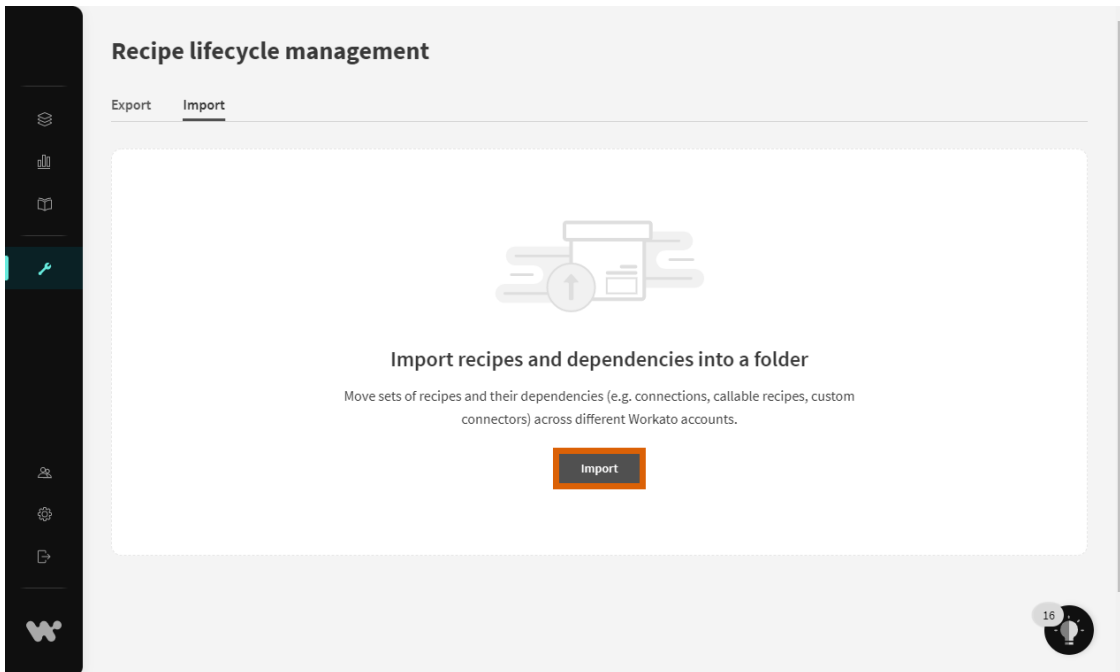

## Workato Operations

### Project Creation

Sign into the Workato portal and navigate to the Projects tab. Start configuring your new Workato project by clicking the **Create project** button.

Next, it is required to import recipes to the Workato system. Proceed to **Tools > Recipe lifecycle management** and switch to the **Import** tab. Click the *Import* button to launch a wizard and select a ZIP file that contains your Workato recipes.

As a result, the required recipes will be imported and your Workato project will be successfully configured. In case you do not have the required ZIP file, please contact our support.

## Properties Configuration

Once your project is created and the recipes are successfully imported to the Workato platform, it is necessary to configure account-level properties that are required to work with recipes. Proceed to **Tools > Properties** and create required properties as follows:

Property name	Value
default_hub_id	Paste your hub identifier that is copied from the CloudBlue Connect platform.
zuora_base_url	In case it is required to integrate the Zuora platform, add this property and assign the Zuora tenant rest API address.

## Connection Configuration

Once your recipes are imported successfully, the Workato system should add a CloudBlue Connect Connector within the **Connections** section. In case you do not have access to CB Connect Connector on the Workato platform, please contact our support.

Switch to the **Projects** tab and access your Connections list. Select the *CloudBlue Connect Connector* from the list and specify your generated API key value within the **API Token** field.

Therefore, the CloudBlue Connect platform will be successfully integrated to the Workato platform. Note that it is also required to configure your target application and your target application connectors as described in the [Zuora Integration](#) article.
